Small Business Tech Checklist

Tick what is true today. Anything unticked is worth a look. About 10 minutes.

Website & Google profile

- [ ] My website loads in under 3 seconds on my phone.
- [ ] The site works well on a phone: text is readable, buttons are easy to tap.
- [ ] My hours, address and phone number match everywhere (site, Google, Yelp).
- [ ] My Google Business Profile is claimed and I can log in to it.
- [ ] Customers can order or book on my own site, not only through a third-party app.
- [ ] I know how much I paid in delivery-app or booking-platform fees last month.
- [ ] I own my domain name and know who to call if the site goes down.

Network & Wi-Fi

- [ ] Wi-Fi reaches every room where staff or customers use it.
- [ ] Customers use a guest network, separate from my staff network.
- [ ] My POS, cameras and printers are not on the guest network.
- [ ] The router admin password is not the one printed on the sticker.
- [ ] My router and Wi-Fi access points get firmware updates.
- [ ] I have a simple list of my devices, my internet provider and its support number.

Security & backups

- [ ] Multi-factor authentication is on my email, bank and website accounts.
- [ ] Each person has their own login; nobody shares one password.
- [ ] I use a password manager instead of reusing passwords.
- [ ] Important files are backed up in a second place automatically.
- [ ] I have tested restoring a file from backup in the last year.
- [ ] Staff know not to click unexpected links or pay unexpected invoices without a call.
- [ ] Computers and phones install updates, and former staff no longer have access.

Accessibility (ADA / Unruh risk)

- [ ] Images on my site have short descriptions for screen-reader users.
- [ ] I can use the whole site with just a keyboard (Tab and Enter).
- [ ] Text is easy to read against its background colour.
- [ ] Forms have visible labels and clear error messages.
- [ ] My site does not rely on an accessibility overlay widget as its fix.
- [ ] Someone has checked the site against WCAG 2.1 AA.

California's Unruh Civil Rights Act lets customers claim damages over inaccessible sites. Overlay widgets do not remove that risk; fixing the site itself does.
